Kubernetes Ingress

Nilesh Gule @nileshgule

TechTalks Application Architecture

What is Kubernetes Ingress?

Ingress

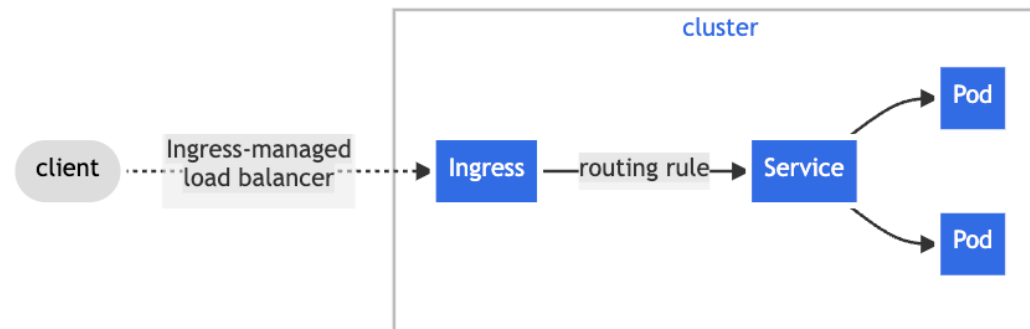

FEATURE STATE: `Kubernetes v1.19` `[stable]`

An API object that manages external access to the services in a cluster, typically HTTP.

Ingress may provide load balancing, SSL termination and name-based virtual hosting.

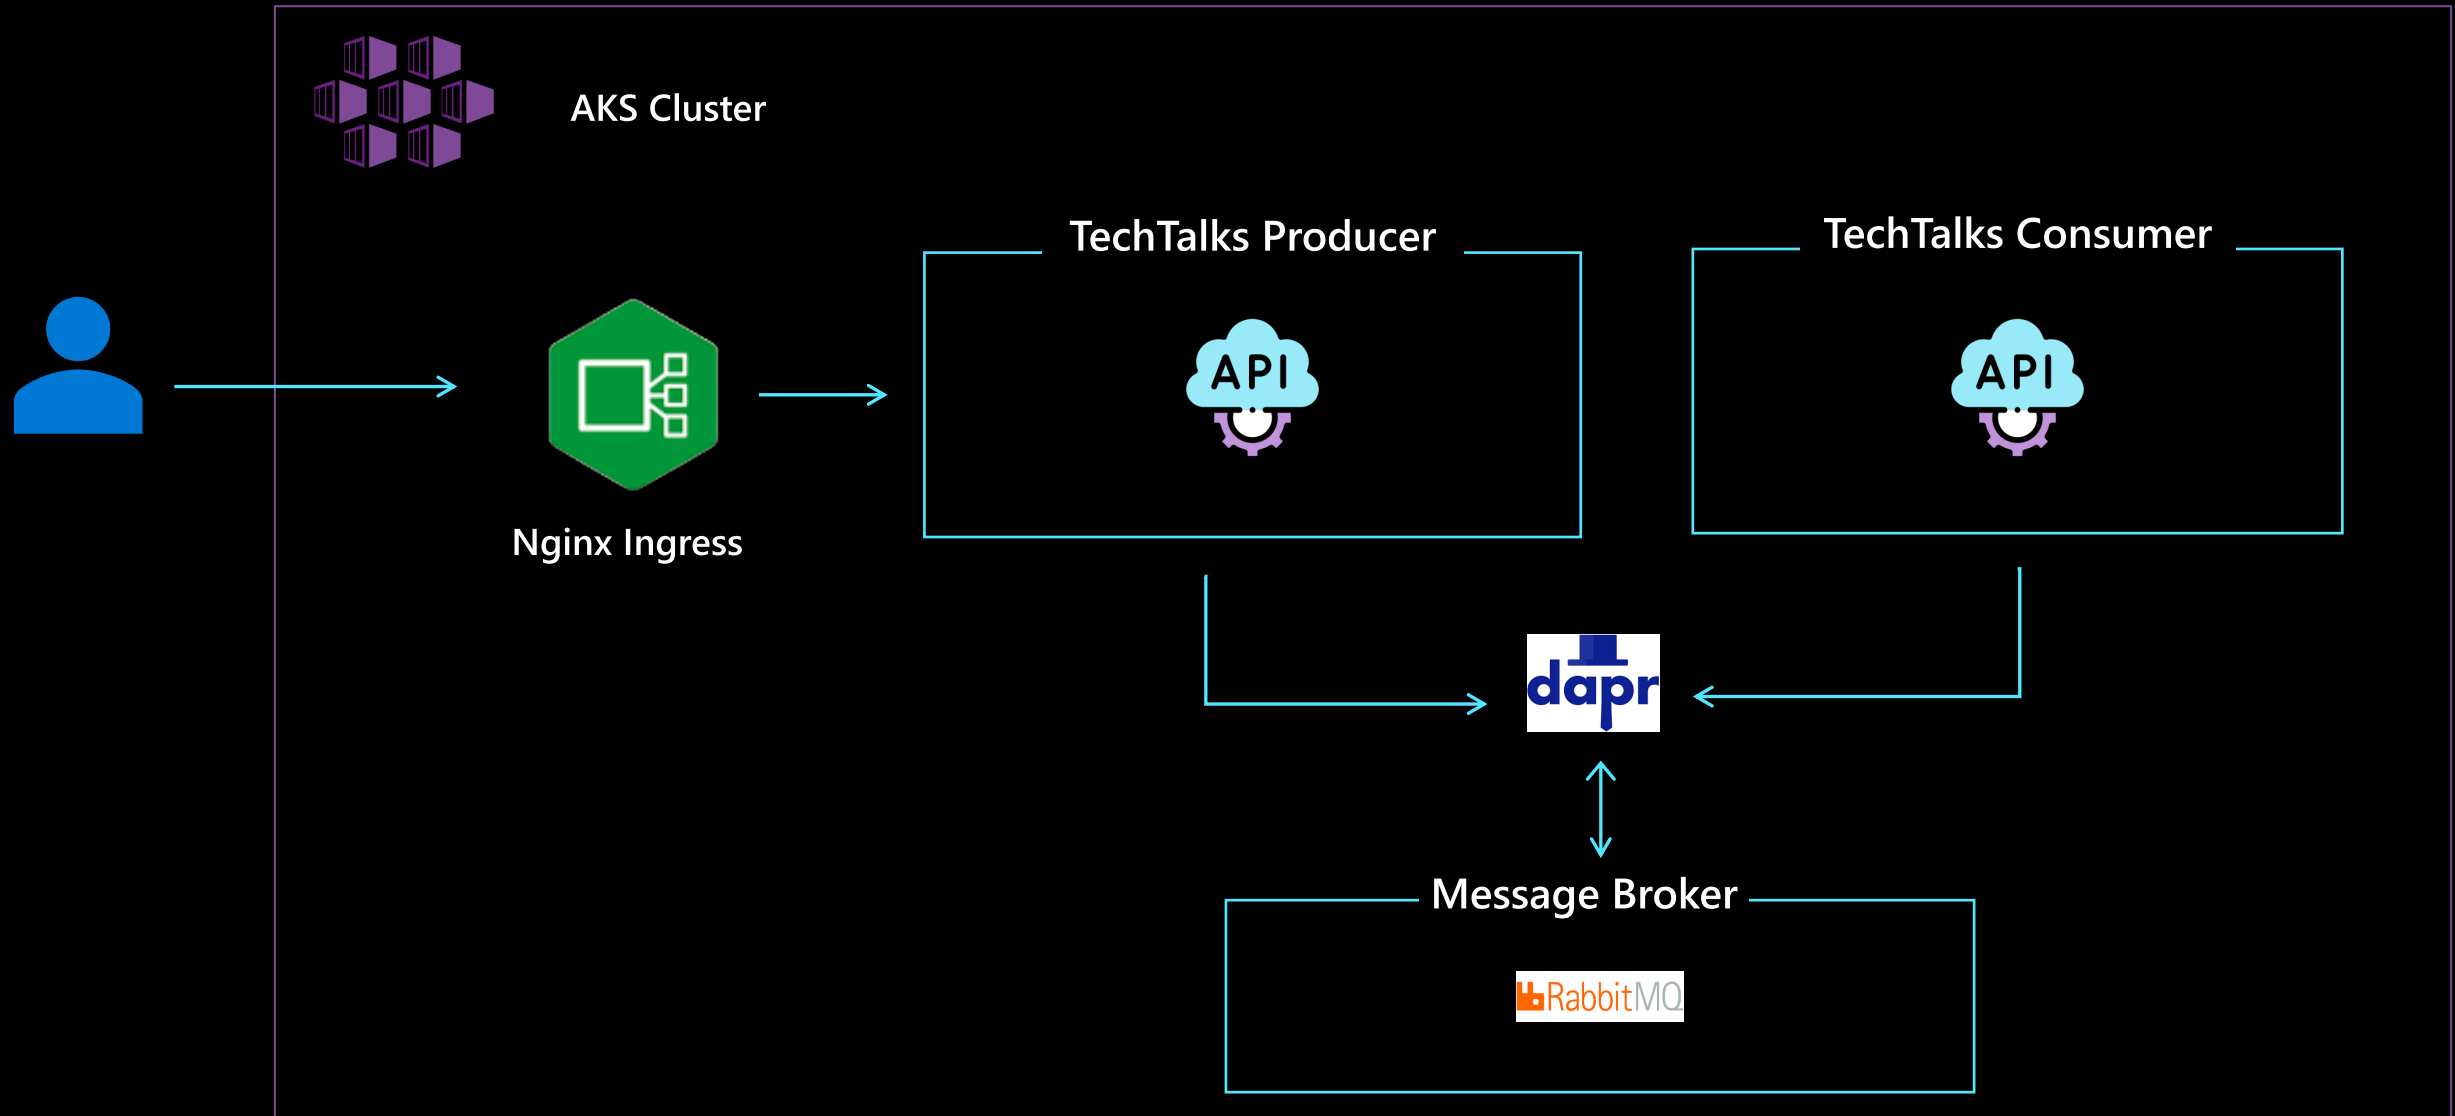

`Ingress` exposes HTTP and HTTPS routes from outside the cluster to `services` within the cluster. Traffic routing is controlled by rules defined on the Ingress resource.

Here is a simple example where an Ingress sends all its traffic to one Service:

<https://kubernetes.io/docs/concepts/services-networking/ingress/>

TechTalks Application – Nginx Ingress

Key Features of Kubernetes Ingress

Ingress Controller

Implements rules defined in **Ingress Resource**

Manages underlying **load balancer** and **reverse proxy** configuration to route traffic to appropriate service

Rules and Paths

Ingress resources defines **rules** to specify how traffic should be routed based on **requested host** and **URL paths**

TLS Termination

Ingress resources can configure **TLS** termination allowing for **secure HTTPS connections**

Rewrites & Redirects

Ingress can be used to rewrite or redirect URLs to create **custom routing** and **URL transformations**

Ingress best practices

- ✓ **Use Managed Ingress Controller:** Use well-maintained and community-supported Ingress Controller, such as **NGINX Ingress Controller**, **Traefik**, or **HAProxy Ingress**. These are often updated with security patches and new features.
- ✓ **Define clear naming conventions:** Establish consistent naming convention for Ingress resources
- ✓ **Split Ingress resources:** Avoid creating a single large Ingress resource with many rules and paths. Create multiple Ingress resources, each responsible for a specific application or service
- ✓ **Enable RBAC:** Restrict access to Ingress-related resources and enhance security using RBAC
- ✓ **Implement High Availability:** Deploy Ingress controller with high-availability configuration to ensure reliability and fault tolerance
